TIC TAC TOE learnings :

1. <Strings>.equals(“ ”);

   This function gives us the ability to check whether any string object contains the passing string [i.e. its arguments]

2. !<Strings>.equals(“ ”);

   This function gives us the ability to check whether any string object does not contains the passing string [i.e. its arguments]

3. Toast

   Using toasts we can show some message to the user . It is displayed for some definite time and then disappears .

   Syntax :

```
Toast toast = Toast.makeText(this /* MyActivity */, text, duration);
toast.show();
```

4. Defining custom fonts for project

Custom fonts can be declared in the theme folder which can be generally found in

App > res > value > themes

In theme folder we can give fonts as

```
<item name="fontFamily">@font/iransans</item>
<item name="android:fontFamily">@font/iransans</item>
```

Under resource or style tag

make sure you have downloaded that font earlier to do so

Varela font is not that bad by the way for use

5. Shortcuts

Change all occurrences = `shift + ctrl + alt + j`

Jumping from xml to java = `ctrl + left click`

6. onClick attribute

this attribute is very useful when we work with buttons in xml
